Recurrence of per-family copy-number changes across 7 primary origins vs two permutation nulls (B=1000; bars = mean, whiskers = 95%)
Expanded in the multicellular clade vs its sister
≥2: p₂=0.981; ≥3: p₂=0.049; ≥4: p₂=1.000
1953
42
3
number of Pfam families (symlog)
primary origins (of 7) where the family is significantly expanded (BH q<0.1)
Contracted in the multicellular clade vs its sister
≥2: p₂=0.001; ≥3: p₂=0.001; ≥4: p₂=0.004
1483
157
20
2
primary origins (of 7) where the family is significantly contracted (BH q<0.1)
observed
null 1: label permutation (pre-specified)
null 2: family shuffle, per-origin counts kept (added)
